MARTHA TAYLOR

Senior Full Stack Product Engineer

UK remote-first, open to hybrid · LinkedIn Email Portfolio

PROFESSIONAL SUMMARY

Product engineer with 7+ years building features start to finish — scoping with designers and product managers, building across the stack, and staying with it through release and measurement. Front-end craft is where I started (Google & Udacity Front End Web Development & Design, top 2% EMEA) and design collaboration is where I do my best work: I rebuilt design-to-development handover at TCS around shared component standards, cutting lead time for changes by 70%. Since then I've shipped conversion-critical journeys in regulated finance, run A/B testing programmes at M&S, and put LLM features in front of clinicians. React, TypeScript, Node.js, NestJS. Twice acting tech lead. I care about shipping something polished more than shipping something big.

CORE SKILLS

Frontend

React | Next.js | TypeScript | JavaScript (ES6) | Vue | HTML5 | CSS3 | Tailwind | Accessibility | Component standards & design systems

Backend

Node.js | NestJS | GraphQL | REST APIs | Python | Java 17 (Spring Boot) | PostgreSQL | Redis

Product & Delivery

Discovery & scoping | A/B testing (Adobe Target) | Stakeholder management | Exec presenting | Technical design docs & API specs | Mentoring | DORA metrics

AI Features

LLM-assisted product features | Prompt design | Structured & grounded output with validation | Streaming AI output | Agentic tool-calling | MCP-based tooling | n8n workflow automation

Quality

Playwright | Cypress | Jest | Postman | E2E automation in CI/CD with quality gates

Cloud & Tooling

AWS | GCP | Docker | Kubernetes | Terraform | GitHub Actions | Grafana | Datadog

Architecture & Security

Microservices | Event-driven architecture | DDD | C4 model | OAuth | RBAC | OWASP Top 10

EXPERIENCE

Health Innovation Labs

May 2025 — Present
Dublin

Healthcare SaaS for professional services management

Senior Full Stack Software Engineer

- Took prescription completion from 40% to 85%. Owned the e-signature problem from discovery onwards — ran the competitor and compliance analysis, made the build-vs-buy call, integrated DocuSeal, and cut cost 72% against the alternatives. The completion rate was the number I was accountable for, and it more than doubled.
- Shipped an AI feature clinicians actually trust. Built ChatAdvisor, an LLM-based clinical call-summarisation feature. The hard part wasn't the model, it was reliability: structured, grounded output validated before a clinician ever saw it. Saved 3–5 minutes of documentation per interaction.
- Designed the prescription service around the user's workflow rather than the database — event-driven NestJS, GraphQL and DDD supporting real-time automation, so the product reacts to what a clinician does instead of making them wait.
- Made polish cheap. Built Playwright E2E into CI/CD with quality gates, raising deployment frequency while keeping the bar high.
- Integrated Shopify across subsystems with data-integrity safeguards, improving mean time to restore. Implemented OAuth, RBAC, session management and OWASP-aligned API patterns.
- Wrote technical design documents and API specifications, and mentored junior engineers through code review and pairing.

Consumer subscription product and internal developer platform; acting tech lead twice

Senior Full Stack Software Engineer

- Removed the biggest drop-off point in a regulated financial journey. Built the affordability check for the Pivotal car subscription app, integrating the Equifax API for credit decisioning across multiple linked UK bank accounts — and used Face ID to keep users in-app rather than bouncing them out to each bank in turn. A UX decision that fixed a conversion problem.

- Let the business change product rules without a redeploy. Extended the Open Policy Agent (Rego) layer governing subscription eligibility, keeping criteria like age, licence tenure and permitted location out of application code so the product team could iterate on them directly.
- Built a design-system-style template library with real adoption. Delivered 25+ reusable golden-path templates (React, Node.js, Python, Go, GKE, Pub/Sub, BigQuery) on the Backstage developer platform, treating JLR's engineering teams as my users. New-application setup dropped from days to minutes.
- Shipped a breaking upgrade nobody else felt. Led React 17 to 21 plus a Node and OS refresh, sequencing the dependency chain so the blast radius stayed isolated from other products, with staged rollout plans and documentation other teams could reuse.
- Led a nine-person squad through a merger. Brought TCS contractors and JLR engineers onto shared standards, tooling and backlog under TUPE. Set the delivery structure, mentored the incoming engineers, ran cross-functional delivery across remote and onsite, and presented to the board of directors and senior solution architects.
- Stepped in when the senior lead went off sick and led two engineers to deliver the Special Vehicles Event Services API for a high-value, time-boxed event — Salesforce integration against a third-party frontend, senior stakeholders managed, shipped on time.
- Halved debugging time with Grafana observability; introduced DevSecOps scanning and CI/CD quality gates across the platform.

Sagittarius Agency
Jan 2022 — Nov 2022
London

Senior React Software Engineer

- Built React frontends for finance, retail and e-commerce clients, delivering measurable usability, performance and conversion improvements against tight deadlines — multiple products, multiple design languages, short cycles.
- Mentored junior engineers and managed client stakeholders directly.

Tata Consultancy Services
Apr 2019 — Jan 2022
London

Full Stack Software Engineer

- Rebuilt design-to-development handover and cut lead time for changes by 70%. Worked with the Director of Design & Innovation in the TCS design studio to introduce shared component standards and bring engineering into the design process earlier — the same problem design systems tooling exists to solve.
- Ran experimentation for M&S as sole developer on the A/B testing and optimisation team, reporting to two optimisation managers. Shipped experiments in Adobe Target across enterprise e-commerce journeys, turning hypotheses into production variants and feeding results back into the roadmap.

- Worked across frontend and backend on large-scale retail platform changes; built CI/CD pipelines with security and dependency scanning.
- Created TDD documents, API design documents and rollout plans; mentored juniors and built a knowledge-sharing culture.

EDUCATION & CERTIFICATION

- Google & Udacity NanoDegree — Front End Web Development & Design (top 2% of EMEA)
- Technological University Dublin — BSc (Hons) Digital Technology, Design & Innovation
- Dublin Business School — Digital Marketing Certificate (Hons)
